

PERSEUS COMPUTING LLC

Make AI-enabled C2 and software delivery reviewable across the handoff.

Perseus gives AI-enabled C2 and software-factory workflows a local Context Engine, governed Vault memory, and Ledger evidence layer—an enabling component that can sit beside the mission platform.

FOCUS Enabling fit	DEPLOYMENT Local · on-premises · private VPC · disconnected enclave	IDENTITY UEI PJS2LW7HAK35 · CAGE 22JC5	LICENSE MIT · SBOM published
------------------------------	--	---	--

THE USEFUL DIFFERENCE

THE PROBLEM

Distributed teams and agents move through repositories, decisions, operational artifacts, and evolving mission context. When state disappears between sessions or handoffs, software-factory work becomes harder to review, re-plan, and trust.

THE LAYER

Context Engine supplies a bounded starting state, Vault preserves the working record across sessions, and Ledger records what was used and what happened. The contribution is intentionally modular so a prime or mission-system owner can retain system authority.

WHAT PERSEUS PROVIDES

CONTEXT ENGINE Before action	Resolves live repository, ticket, deployment, and decision state into bounded context before an agent uses it.
PERSEUS VAULT Across sessions	Retains governed, bitemporal memory and local retrieval with durable journaling and explicit authority boundaries.
LEDGER After action	Records evidence, authority, approvals, and time so captured actions and served context can be reviewed later.

WHERE IT FITS

ROUTE	USE	ROLE
SOFTWARE FACTORIES	Durable context across agent sessions, repositories, tickets, deployments, and engineering handoffs.	Direct fit
RESILIENT C2	Evidence-backed memory for workflows that must be re-planned, handed off, and reviewed.	Enabling fit
PRIME BOUNDARY	A modular contribution that can support a prime-led system and possible small-business carve-out without replacing the mission platform.	Enabling fit

FIRST CONVERSATION Bring one software-factory, resilient-C2, or distributed-decision workflow, the handoffs that fail today, and the existing integration surface; we are seeking the right technical owner or SBO carve-out route, not claiming an existing C3BM integration.

EVIDENCE AND PROCUREMENT

Proof with the condition attached.

The figures below are kept separate by measurement family so a reviewer can see what each result does—and does not—establish.

MEASURED EVIDENCE

MEASURE	RESULT	WHAT IT SHOWS	SCOPE
LongMemEval-S QA	82.0%	Latest completed full paired QA result: 410/500 candidate cases under the official-CoT answer prompt.	500q internal confirmation · control 83.2%
Session retrieval	99.2%	Relevant session memories remain available to the later task.	Retrieval-only · recall@10
BEAM correctness	13/13	The deterministic gauntlet stays correct across token tiers.	128K–10M token tiers
Durable write	40/s	Sustained write behavior at a 100K-entity scale.	Signed report · not bulk insert

LongMemEval-S: 82.0% candidate (410/500) vs 83.2% matched full-context control (416/500), -1.2 points. Execution/custody passed, but the preregistered success rule failed; no superiority, independent-holdout, or production-promotion claim is made. The provider-free rerun is provisional.

PROCUREMENT AND DEPLOYMENT

COMPANY		SECURITY AND BOUNDARY	
Legal name	Perseus Computing LLC	Deployment	Local, on-premises, private VPC, or customer-configured disconnected enclave
Business	U.S. small business · technical access	Readiness	SPRS 110/110 · CMMC Level 2 self-assessment, enclave scope
UEI / CAGE	PJS2LW7HAK35 / 22JC5	Software	MIT license · published SBOM
NAICS	541715 · 541511 · 541512	Data posture	No required cloud service, API key, or vendor runtime
SAM.gov	Active — All Awards	Integration	Partner-led where mission hardware or sensors are involved
JCP / DD2345	Approved · valid through 2031-08-18		

CURRENT ENGAGEMENT C3BM is a warm Hanscom small-business route after the 14 August meeting. The objective is technical routing for a bounded enabling component; prior proposals are R&D status facts, not C3BM sponsorship or awards.

SCOPE IN ONE SENTENCE

Perseus is the infrastructure around the model: context before action, governed memory across sessions, and evidence after action. It is not a claim to replace a mission platform, prime integrator, or sensor system.
