

CAPABILITY STATEMENT

# Software-factory agents need memory that survives the handoff.

Perseus gives AI-enabled C2 and software-factory workflows a local context and evidence layer without claiming to be the mission platform.

## THE PROBLEM WE SOLVE

Distributed teams and agents move through repositories, decisions, and operational artifacts. When state disappears between sessions, software-factory work becomes harder to review, re-plan, and trust.

### WHAT CHANGES

Perseus keeps the context and provenance available at the boundary where the work is done, so a later agent or operator can start from a defensible record.

## THE PERSEUS SYSTEM

|                                                                                                                                                                         |                                                                                                                                                                      |                                                                                                                                                                                               |

## WHERE THIS FITS

|                                   |                                                                                         |
|-----------------------------------|-----------------------------------------------------------------------------------------|
| SOFTWARE FACTORIES<br>PRIMARY FIT | Durable context across agent sessions, repositories, tickets, and engineering handoffs. |
| C2 / DECISION<br>ENABLING FIT     | Evidence-backed memory for workflows that must be re-planned and reviewed.              |
| PARTNER BOUNDARY<br>ENABLING FIT  | An enabling layer that can sit beside the mission platform, not a claim to replace it.  |

EVIDENCE AND PROCUREMENT

Proof first. Claims stay attached to their method.

The figures below are drawn from the public claims registry. They are presented with the measurement family and condition that give each number meaning.

MEASURED EVIDENCE

79.0%

LongMemEval QA  
Official-CoT mean of three signed runs.

99.2%

Session retrieval recall@10  
Retrieval-only session-level result.

13/13

BEAM correctness  
Every 128K–10M token tier; deterministic gauntlet.

40/s

Durable sustained write  
Signed scale report at 100K entities; not an in-memory insert rate.

Measured on named hardware with signed or committed reports and rerunnable methods. Methodology variants remain separately labeled. No customer ROI, customer cost savings, or compliance certification is implied by these figures.

PROCUREMENT FACTS

COMPANY

Legal name  
Perseus Computing LLC

Business  
U.S. small business · founder-led technical access

UEI / CAGE  
PJS2LW7HAK35 / 22JC5

NAICS  
541715 · 541511 · 541512

SAM.gov  
Active — All Awards

SECURITY AND DEPLOYMENT

Boundary  
On-premises, air-gapped, private VPC, or controlled network

Readiness  
SPRS 110/110 · CMMC Level 2 final self-assessment, enclave scope

Software  
MIT license · published SBOM · NIST AI RMF-aligned architecture

Data posture  
No required cloud service, API key, or vendor runtime

Integration  
Partner-led where mission hardware or sensors are involved

DEPLOYMENT BOUNDARY

Run the context, memory, and evidence layers where the program keeps its working data.  
Air-gapped, on-premises, private VPC, and controlled-network deployment are supported postures.
